#### New Toro Precision™ Series Rotating Nozzles Introduced

RIVERSIDE, Calif. (Nov. 2, 2008) – Toro today introduced its new Precision™ Series Rotating Nozzles, which are true gear-driven units that combine low precipitation rates with larger-radius watering for high-efficiency turf maintenance.

The new Toro Precision Series Rotating Nozzles have a precipitation rate of 0.6” of water per hour, so water is delivered evenly across the desired arc at a rate the soil and turf can thoroughly absorb and utilize. Run-off and saturation are eliminated, and the desired irrigation can be completed within the available watering window.

“The new Precision Series Rotating Nozzles deliver water smoothly and evenly over a greater radius of up to 25 feet,” said Don Fisher, product and marketing manager for Toro Irrigation. “These are true gear-driven products, so they provide consistent delivery and maintain the desired radius even with lower operating pressure. The delivery is precise, efficient and uniform, which helps maintain beautiful turf while conserving water.”

With only a small, metered flow across the turbine, the Toro Precision Series Rotating Nozzles deliver smooth, consistent nozzle rotation. Unlike competitive models, they are less susceptible to stalling when operating under low pressure. Along with meeting performance requirements for new systems, these nozzles are versatile replacements in damaged or distressed systems.

The Precision Series Rotating Nozzles are available in models with a radius of between 10’ and 25’. A radius reduction of up to 25% is achieved by turning a set screw atop the nozzle, while the precipitation rate is maintained as the radius is reduced.

The nozzles are available in models with adjustable arcs of between 90° and 270°, with a separate full circle model at 360°. They can be used with operating pressures of between 20 and 65 psi.
